

AUTOMATION FOR 3-4-6m BOOMS

Automatic Barrier With a 230Vac Motor

EL is a range of road barriers, consolidated and optimised throughout time, which features a vast array of models built from hard wearing and highly reliable materials and using state of the art technology.

The cabinet in cast aluminium, housing the mechanical parts, is made up of modular components which are highly resistant to atmospheric agents and are easy to replace in case of accidental damage. All the inspection ports giving access to the internal components are lockable and are fitted with security microswitches.

The flip-back top cover is made of shockproof materials and can be supplied with incorporated warning lights.

The centralised movement of the boom makes the barrier perfectly symmetrical and allows it to be installed both to the left and to the right of the passageway.

The incorporated electronic programmer conforms to the local standards and regulations in force and is fitted with all the connections needed to carry out a complete automatic installation.

A vast range of accessories allows all types of installation on passageways of up to **3**, **4** and **6** metres.
